

# Eclipse Trust Framework (ETF) Creation Review

**SocialPhysics**

April 6, 2005

## What is ETF?

### **An abstraction layer for identity and social networking services**

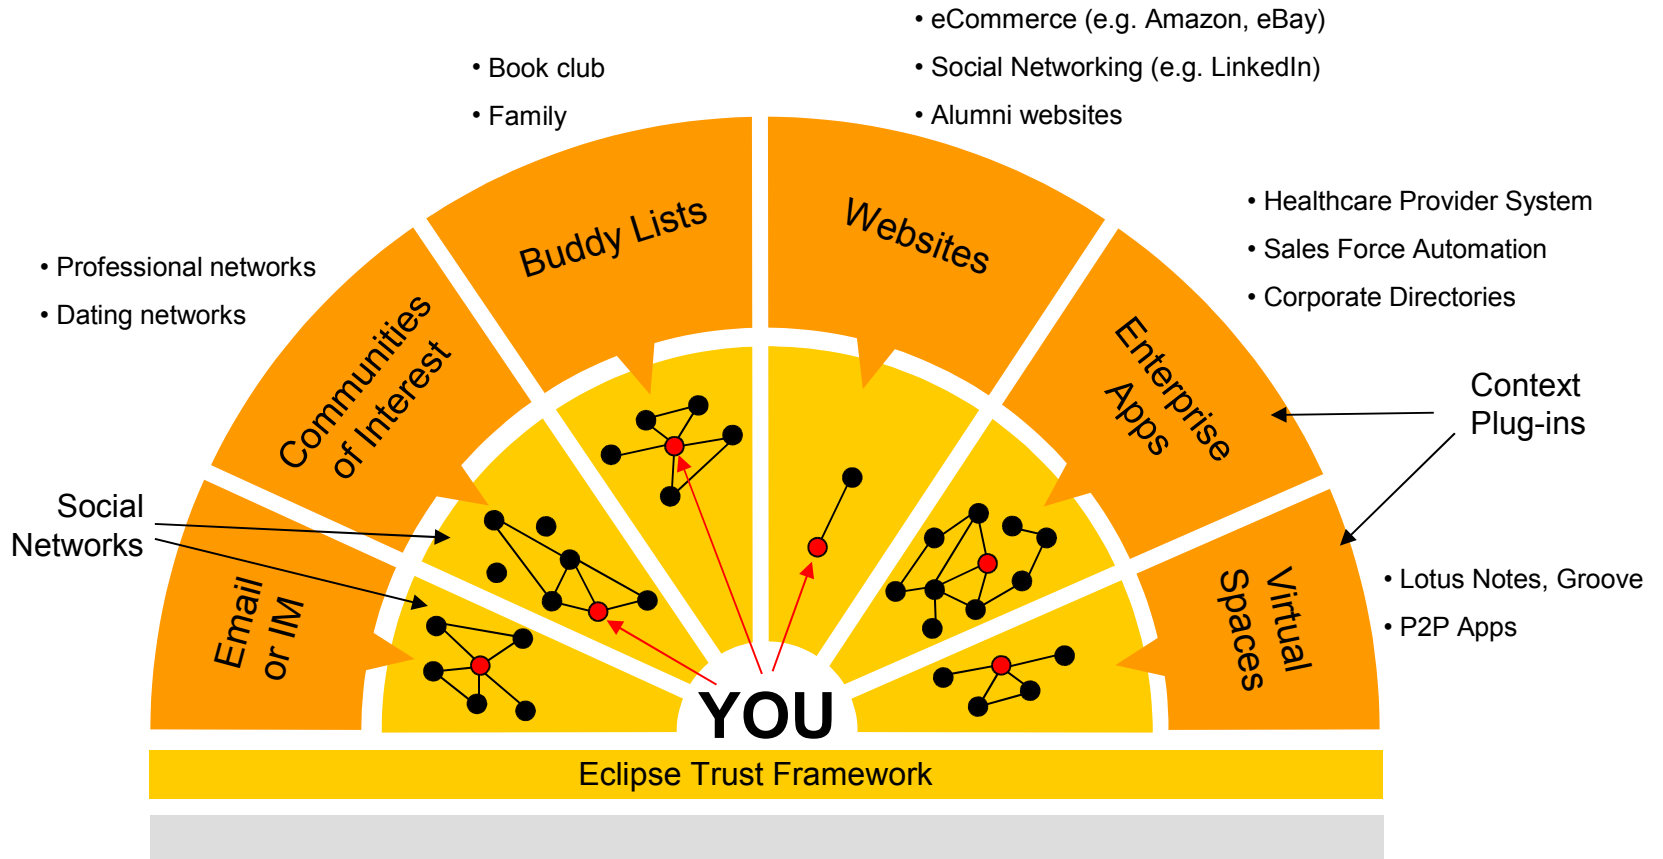

- Presents a common unifying interface to communications systems, directories, social networks, personal information managers, identity systems
- Leverages plug-ins to:
  - Adapt existing services to this interface or
  - Offer new services that conform to this interface
- Provides a mechanism for implementing application- and user-specific policies for sharing personal information
- Offers security and privacy

See <http://www.eclipse.org/proposals/etf/index.html>

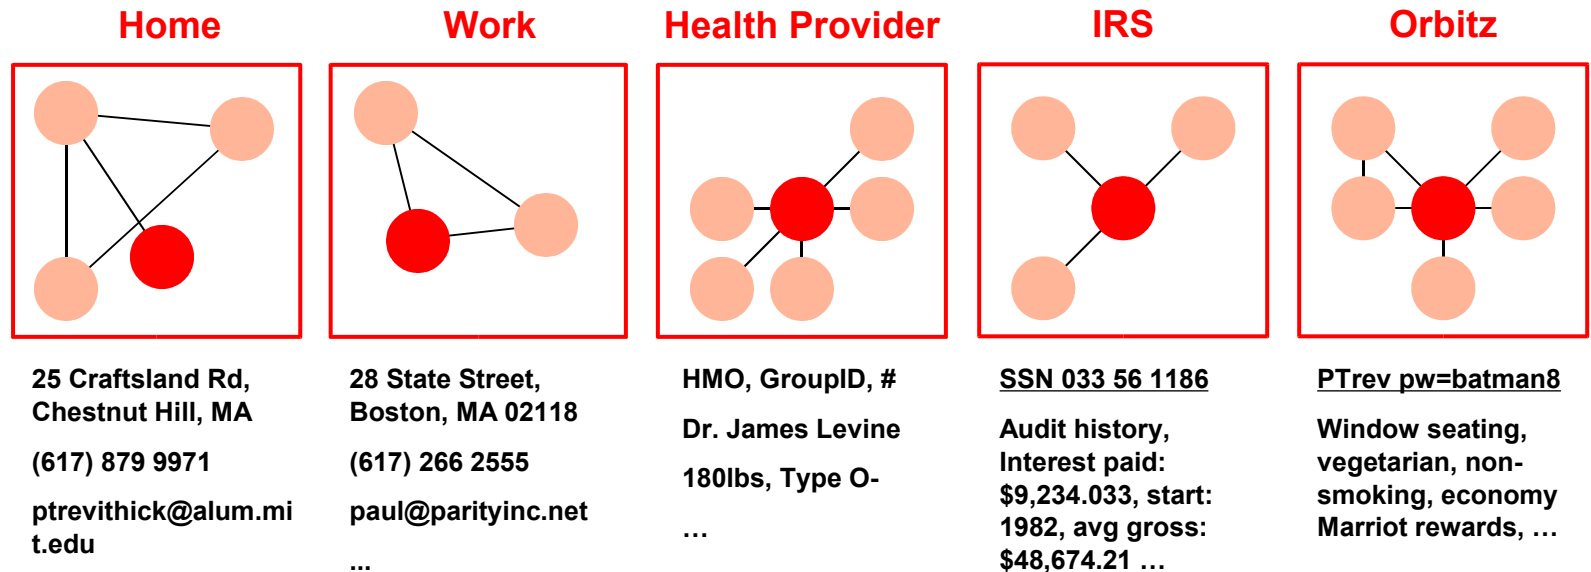

## Project Goals

1. Create a framework/API
2. Create a set of exemplary context “provider” (plug-ins)
3. Create an exemplary demo app

# Multiple Contexts

## Different attributes for every context

This **enables** what you do want: *the right people to find you, have what's appropriate be visible, etc.*

# Enables and prevents sharing, searching, exposure

**Eclipse Trust Framework**  
Context Manager

Eclipse 3.1

Java 1.4.2+ on Windows, Mac & Linux (Desktops and Servers)

## What components are in it?

- IContext interface is the center of gravity
- Context plug-ins currently under development leverage:
  - Eclipse EMF and SDO
  - Eclipse ECF
  - IBM China's EODM RDF
- Future plug-ins may use:
  - FOAF
  - WS-Trust
  - XRI/XDI (OASIS)
  - OpenLDAP
  - ...lots more

# Who is currently involved?

## Committers

Paul Trevithick, Dmitry Bakuntsev, John Beatty, Andy Dale,  
Ken Gilmer, Scott Lewis ,Peter Nehrer, Mary Ruddy, Paul Weitz

## Interested Parties

# Project Road Map

## Status

### Now

- Framework/API
- Exemplary Plug-ins
- Exemplary app

### Future

- Support for eRCP
- More context plug-ins
- “Social” Eclipse -- Eclipse IDE with social networking and reputation metric capabilities
